The Royal College of Psychiatrists is a charity registered in England and Wales (228816) and in Scotland (SC038689).
International Psychiatry was originally published on (and submitted) the Bulletin of the Board of International Affairs of the Royal College of Psychiatrists. Printed in the UK by Henry Ling Limited of the Donkin Press, Donkin 1911 (1984).

Notice to contributors
International Psychiatry publishes original research, critical reviews, mental health law papers and thematic overviews, dealing with mental health policy, promotion and legislation, the administration and management of mental health services, and training in psychiatry around the world. Correspondence as to style for the notes and news columns will also be considered for publication. The journal also will publish an electronic platform for work that is generally underrepresented in the literature, exploring psychiatry research and opinion from low- and middle-income countries.

Manuscripts for publication must be submitted electronically to the Editor (ngodhode@rcpsych.ac.uk), with a copy sent to the Sabinet (sabinet@rcpsych.co.za). Research papers and special articles printed in this journal will be no longer than 1500 words, at the Editor’s discretion, longer versions of papers have been successfully peer reviewed may be linked to the online version of the journal in manuscript form. Correspondence should be no longer than 500 words.

The Harvard system of referencing should be used. Manuscripts accepted for publication are copy edited to improve readability and to ensure conformity with house style. Authors whose first language is not English are encouraged to contribute; our copy-editor will make any necessary corrections, in consultation with the authors.

Contributions are accepted for publication on the condition that their substance has not been published or submitted elsewhere. Once a paper is accepted for publication, all authors are required to disclose any potential conflict of interest. Completion of the form for disclosure developed by the International Committee of Medical Journal Editors for this purpose (www.icmje.org/doi/еклвзвдз.pdf) is mandatory.

About our peer-review process
All articles submitted to the peer reviewers to ensure that their content, length and structure are appropriate for the journal. Research papers and special articles are reviewed by a minimum of two peer reviewers. Not all papers will be accepted for publication, but our peer-review process is intended to assist our authors in polishing articles for worldwide dissemination. Whenever possible, our expert panel of assessors will help authors to improve their papers to maximise their impact when published.

The impact of the uprising in Egypt on mental health in a private hospital

Sir: After the recent uprising in Egypt, doctors expected a rise in the incidence of mental health disorders, especially cases of post-traumatic stress disorder (PTSD), but saw, surprisingly, a reduction in the number of admissions in the first few weeks. It is assumed that the curfew and the reduction in family income for many was behind this. Having said that, many other disorders – including organic mental disorders, such as traumatic brain injury, substance use disorders and subsequent drug-induced psychoses – seemed to have increased in incidence. Exacerbation of episodes of schizophrenia was also observed, with some of the persecutory delusions being related to surveillance by the police. Some patients had manic episodes that they correlated with the stress during the uprising. Depression and adjustment disorder were an expected occurrence. Bereavement reactions were observed not only over lost lives, but also among families of members of the old regime who were arrested.

There were logistical challenges as well. Shortages of medication became one of the difficulties that patients and doctors encountered. One new antidepressant’s launch was postponed for a few months to accommodate the unrest. A local unit could not administer electroconvulsive therapy (ECT) owing to the erratic electrical supply and an ECT anaesthetist admitted to feeling exhausted because of the number of people that she treated elsewhere.

Early in the uprising, the curfew prevented some doctors from making it to work. Communication and access to information were a bit difficult without internet and mobile phones. Later, many doctors found themselves engaging in discussions with acutely ill patients who were asking for their rights to participate in parliamentary and later in presidential elections.

The uprising seems to have had both expected and unexpected consequences for mental health services and their users in the short term, and both time and a more systematic analysis will be required to ascertain the longer-term consequences.

Report on drug and alcohol use in Iraq: the inaugural meeting of the Community Epidemiology Work Group

Sir: The initial meeting of the Iraq Community Epidemiology Work Group (CEWG), 8–9 May 2012, held in Baghdad, brought together leaders and representatives from the public health and mental health sectors, law enforcement agencies, the universities, the governors, non-governmental organisations (NGOs) and the Ministries of Health, Interior, Labour and Social Affairs, Youth and Sports, and Justice, as well as international technical assistance experts. The 2-day meeting reviewed the importance of and methods for developing a capacity in Iraq for better understanding the nature and extent of the drug and alcohol problem in the country and reviewed some of the existing data on this topic. Iraqi and international speakers provided background and a rationale for using the CEWG methodology as an optimal approach. Fourteen reports presented data on the current use of drugs and alcohol in Iraq. Ways of improving future CEWG meetings by expanding the types and sources of data were discussed in a workshop.

The findings from this meeting suggest that, since the reports by Aqrawi & Humphreys (2009) and Al-Diwan (2011) on drug use in Iraq, summarised by Rawson (2011), some things have remained relatively stable, while there have been significant changes in other areas. The psychoactive substances most widely used in Iraq continue to be alcohol, benzodiazepines, benzhexol, codeine and a variety of psychiatric medications. This set of ‘primary drugs’ is consistent with the earlier reports. However, there was near universal agreement that the use of hashish, tramadol (an opioid-type analgesic) and amphetamine-type substances (ATS) is increasing rapidly in some areas and that drug and alcohol use overall is increasing. Reports from Basrah from health officials and police were noteworthy. Two types of ATS have made an appearance in Iraq: ‘01 pills’ (tablets of captagon, an amphetamine-type drug) and ‘crystal’ (methamphetamine) have been seized in considerable quantities in Basrah. The 01 pills appear to be the same type of ATS that are being used in epidemic amounts in Saudi Arabia, and they appear to be coming into the country via the port of Basrah. ‘Crystal’ is likely coming from Iran, since drug seizures have been near the Iranian border and use of the drug in Iran is extensive. In addition, reports from Mosul and federal drug seizure data suggest that the use of tramadol is increasing substantially in many parts of Iraq. This drug is available to users from pharmacies and from street drug dealers. At present, there is little evidence of increased use of heroin in Iraq, and rates of injection drug use appear to continue to be relatively low.

The CEWG will continue to meet annually or more often to provide an ongoing monitoring programme regarding drug and alcohol use in Iraq.
